EXPERIENCE

Gamespring

Mar 2025 – Aug 2026

Backend Developer, Admin Platforms & AI

South Korea

- Became sole developer of the internal admin platform for a live social casino game (300K lines, 150 features) when its team shrank from three engineers to one; used daily by **90% of staff**, including the CEO.
- Maintained 90% of its features across revenue analytics, live control of 8 game systems, player accounts, and events, shipping **40 new features, 50 upgrades, and 200+ bug fixes**.
- Took over all front-end work with no prior React experience, shipping a first feature in 3 days, then built an AI agent pipeline that shipped **5 features a week** solo, up from 3 for the former three-engineer team.
- Built a self-serve console that let 6 client engineers switch branches across 180 dev server processes themselves, removing an 8-minute wait on backend staff from 12 switches a day (**8 engineer-hours a week**).
- Replaced hand-written SQL edits that needed senior sign-off with self-serve screens for event setup, account changes, and receipt checks, cutting each of customer service's 5–6 daily data tasks from **30 to 10 minutes**.
- Interviewed the customer service team on how they searched players, then moved pagination ahead of multi-table joins and built them a dedicated search view, cutting filtered searches from 60 s to **10 s**, and to **under 1 s** on the new view.
- Fixed a stamp-challenge reset that locked 8 game tables for 2 minutes, freezing or disconnecting live players; scoped it to affected tables and reset players lazily on login, cutting it to **under 2 seconds**.
- Proposed and built JSON-based daily KPI rollups broken down by location, game, room type, platform, OS, and language, cutting support for each new game or product from **2 days to 3 hours** across 3 games and 2 products.
- Built an in-house replacement for the OneSignal push-notification service end to end, ending a **CA\$12K/year** subscription.
- Restored revenue dashboards within **30 minutes** in each of 4 outages caused by unannounced game-server schema changes, backfilling missed scheduled jobs by hand, and agreed with the game-server lead to check schema changes with admin first.
- Triaged 4 requests a week from across the company, holding scoping meetings with requesters when build cost outweighed value; trained new hires on the platform and handed it to the next owner over 3 months with full documentation.

Gamespring

Jul 2024 – Mar 2025

Backend Developer, Game Server

South Korea

- Shipped seasonal mode Christmas Jackpot in **1 day instead of 3** by reusing the payout engine behind a new routing layer.
- Built a time-series heap monitor that found the cause of a production-only memory leak in 2 days; the leak grew a live slot server by 3 GB an hour and forced 2 restarts a week, and **none recurred** after the fix.

PROJECTS

Kelly | *TypeScript, Electron, Node.js, SQLite, Ollama, OpenAI API*

Code/docs on request • Sept 2026 – Present

- Building an open-source, local-first macOS app that logs active apps and keyboard/mouse activity for an AI (local or the user's API key) to score against their focus goals.
- Keeps activity data on device for users to audit, and enforces missed goals with penalties such as automatic stock purchases.

The Nerdiest Dungeon | *Godot, TypeScript, Node.js, PostgreSQL, AWS*

Code/docs on request • Aug 2026 – Present

- Designing a browser-based pixel-art roguelike RPG that turns studying into turn-based combat: learning goals become dungeon roadmaps, monsters are question sets, and correct answers fire skills scaled by difficulty.
- Specified gamified spaced repetition, where earned items expire unless related review questions are solved, and a JSON content layer for community-authored learning paths with AI-generated fallbacks.

What To Cook | *TypeScript, NestJS, PostgreSQL, TypeORM, OpenAI API, AWS EC2, GitHub Actions*

Mar – May 2024

- Built a full-stack recipe platform with TypeORM migrations and seeding, request throttling, HTML sanitization, and DTO validation, supporting five sign-in methods including Google, Facebook, and Twitter.
- Ran it as a live service behind a GitHub Actions pipeline to AWS EC2 with Swagger docs and Jest/Supertest end-to-end tests, routing runtime errors to Slack through Sentry before users could report them.

EDUCATION

University of Toronto

Toronto, ON

Honours Bachelor of Science, Computer Science and Mathematics

Expected 2029

SKILLS

Languages: TypeScript, JavaScript, SQL, Java, Go, HTML/CSS, Python **Spoken:** English, Korean

Backend: Node.js, Express, NestJS, Socket.IO, REST, WebSocket, TypeORM, Passport/JWT/OAuth, Swagger, Jest

Frontend: React, Ant Design, EJS, Handlebars, Bootstrap, Figma

Databases: MySQL/Aurora, PostgreSQL, Redis; EXPLAIN profiling, indexing, window functions, JSON columns, rollups

Infrastructure: AWS (EC2, RDS, S3, CloudWatch, Bedrock), Docker, Kubernetes, GitHub Actions, PM2, Linux, Sentry

AI: Multi-agent orchestration, sub-agent delegation, context engineering, agent rule adherence, prompt design
